Optimization methods. MIPT

Let's consider a linear approximation of the differentiable function f along some direction  $h, \|h\|_2 = 1$ :

າດ ⊘

Let's consider a linear approximation of the differentiable function f along some direction  $h, ||h||_2 = 1$ :

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

Let's consider a linear approximation of the differentiable function f along some direction  $h, \|h\|_2 = 1$ :

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

We want h to be a decreasing direction:

$$f(x + \alpha h) < f(x)$$

$$f(x) + \alpha \langle f'(x), h \rangle + o(\alpha) < f(x)$$

Let's consider a linear approximation of the differentiable function f along some direction  $h, ||h||_2 = 1$ :

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

We want h to be a decreasing direction:

$$f(x + \alpha h) < f(x)$$

$$f(x) + \alpha \langle f'(x), h \rangle + o(\alpha) < f(x)$$

and going to the limit at  $\alpha \to 0$ :

$$\langle f'(x), h \rangle \leq 0$$

Let's consider a linear approximation of the differentiable function f along some direction  $h, ||h||_2 = 1$ :

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

We want h to be a decreasing direction:

$$f(x + \alpha h) < f(x)$$

$$f(x) + \alpha \langle f'(x), h \rangle + o(\alpha) < f(x)$$

and going to the limit at  $\alpha \to 0$ :

$$\langle f'(x), h \rangle \le 0$$

Also from Cauchy–Bunyakovsky–Schwarz inequality:

$$|\langle f'(x), h \rangle| \le ||f'(x)||_2 ||h||_2$$
  
 $\langle f'(x), h \rangle \ge -||f'(x)||_2 ||h||_2 = -||f'(x)||_2$ 

 $f \to \min_{x,y,z}$  Gradient Descent roots

Let's consider a linear approximation of the differentiable function f along some direction h,  $||h||_2 = 1$ :

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

We want  $\boldsymbol{h}$  to be a decreasing direction:

$$f(x + \alpha h) < f(x)$$

$$f(x) + \alpha \langle f'(x), h \rangle + o(\alpha) < f(x)$$

and going to the limit at  $\alpha \to 0$ :

$$\langle f'(x), h \rangle \le 0$$

 ${\bf Also\ from\ Cauchy-Bunyakovsky-Schwarz\ inequality:}$ 

$$|\langle f'(x), h \rangle| \le ||f'(x)||_2 ||h||_2$$
  
 $\langle f'(x), h \rangle \ge -||f'(x)||_2 ||h||_2 = -||f'(x)||_2$ 

Thus, the direction of the antigradient

$$h = -\frac{f'(x)}{\|f'(x)\|_2}$$

gives the direction of the  ${\it steepest local}$  decreasing of the function f.

Let's consider a linear approximation of the differentiable function f along some direction h,  $||h||_2 = 1$ :

$$f(x + \alpha h) = f(x) + \alpha \langle f'(x), h \rangle + o(\alpha)$$

We want  $\boldsymbol{h}$  to be a decreasing direction:

$$f(x + \alpha h) < f(x)$$

$$f(x) + \alpha \langle f'(x), h \rangle + o(\alpha) < f(x)$$

and going to the limit at  $\alpha \to 0$ :

$$\langle f'(x), h \rangle \leq 0$$

Also from Cauchy–Bunyakovsky–Schwarz inequality:

$$|\langle f'(x), h \rangle| \le ||f'(x)||_2 ||h||_2$$
  
 $\langle f'(x), h \rangle \ge -||f'(x)||_2 ||h||_2 = -||f'(x)||_2$ 

Thus, the direction of the antigradient

$$h = -\frac{f'(x)}{\|f'(x)\|_2}$$

gives the direction of the **steepest local** decreasing of the function f. The result of this method is

$$x_{k+1} = x_k - \alpha f'(x_k)$$

Gradient Descent roots

Let's consider the following ODE, which is referred as Gradient Flow equation.

$$\frac{dx}{dt} = -f'(x(t)) \tag{GF}$$

Let's consider the following ODE, which is referred as Gradient Flow equation.

$$\frac{dx}{dt} = -f'(x(t)) \tag{GF}$$

and discretize it on a uniform grid with  $\alpha$  step:

$$\frac{x_{k+1} - x_k}{\alpha} = -f'(x_k),$$

Let's consider the following ODE, which is referred as Gradient Flow equation.

$$\frac{dx}{dt} = -f'(x(t)) \tag{GF}$$

and discretize it on a uniform grid with  $\alpha$  step:

$$\frac{x_{k+1} - x_k}{\alpha} = -f'(x_k),$$

where  $x_k \equiv x(t_k)$  and  $\alpha = t_{k+1} - t_k$  - is the grid step.

From here we get the expression for  $x_{k+1}$ 

$$x_{k+1} = x_k - \alpha f'(x_k),$$

which is exactly gradient descent.

# **Necessary local minimum condition**

$$f'(x) = 0$$
$$- \eta f'(x) = 0$$
$$x - \eta f'(x) = x$$
$$x_k - \eta f'(x_k) = x_{k+1}$$

 $f \to \min_{x,y,z}$  Gradient Descent roots

Minimizer of Lipschitz parabola If a function  $f:\mathbb{R}^n \to \mathbb{R}$  is continuously differentiable and its gradient satisfies Lipschitz conditions with constant L, then  $\forall x, y \in \mathbb{R}^n$ :

$$|f(y) - f(x) - \langle \nabla f(x), y - x \rangle| \le \frac{L}{2} ||y - x||^2,$$

If a function  $f: \mathbb{R}^n \to \mathbb{R}$  is continuously differentiable and its gradient satisfies Lipschitz conditions with constant L. then  $\forall x, y \in \mathbb{R}^n$ :

$$|f(y) - f(x) - \langle \nabla f(x), y - x \rangle| \le \frac{L}{2} ||y - x||^2,$$

which geometrically means, that if we'll fix some point  $x_0 \in \mathbb{R}^n$  and define two parabolas:

$$\phi_1(x) = f(x_0) + \langle \nabla f(x_0), x - x_0 \rangle - \frac{L}{2} ||x - x_0||^2,$$
  
$$\phi_2(x) = f(x_0) + \langle \nabla f(x_0), x - x_0 \rangle + \frac{L}{2} ||x - x_0||^2.$$

If a function  $f: \mathbb{R}^n \to \mathbb{R}$  is continuously differentiable and its gradient satisfies Lipschitz conditions with constant L. then  $\forall x, y \in \mathbb{R}^n$ :

$$|f(y) - f(x) - \langle \nabla f(x), y - x \rangle| \le \frac{L}{2} ||y - x||^2,$$

which geometrically means, that if we'll fix some point  $x_0 \in \mathbb{R}^n$  and define two parabolas:

$$\phi_1(x) = f(x_0) + \langle \nabla f(x_0), x - x_0 \rangle - \frac{L}{2} ||x - x_0||^2,$$
  
$$\phi_2(x) = f(x_0) + \langle \nabla f(x_0), x - x_0 \rangle + \frac{L}{2} ||x - x_0||^2.$$

Then

$$\phi_1(x) < f(x) < \phi_2(x) \quad \forall x \in \mathbb{R}^n.$$

 $f \to \min_{x,y,z}$  Gradient Descent roots

If a function  $f: \mathbb{R}^n \to \mathring{\mathbb{R}}$  is continuously differentiable and its gradient satisfies Lipschitz conditions with constant L, then  $\forall x,y \in \mathbb{R}^n$ :

$$|f(y) - f(x) - \langle \nabla f(x), y - x \rangle| \le \frac{L}{2} ||y - x||^2,$$

which geometrically means, that if we'll fix some point  $x_0 \in \mathbb{R}^n$  and define two parabolas:

$$\phi_1(x) = f(x_0) + \langle \nabla f(x_0), x - x_0 \rangle - \frac{L}{2} ||x - x_0||^2,$$
  
$$\phi_2(x) = f(x_0) + \langle \nabla f(x_0), x - x_0 \rangle + \frac{L}{2} ||x - x_0||^2.$$

Then

$$\phi_1(x) \le f(x) \le \phi_2(x) \quad \forall x \in \mathbb{R}^n.$$

Now, if we have global upper bound on the function, in a form of parabola, we can try to go directly to its minimum.

If a function  $f: \mathbb{R}^n \to \mathbb{R}$  is continuously differentiable and its gradient satisfies Lipschitz conditions with constant L, then  $\forall x, y \in \mathbb{R}^n$ :

$$|f(y) - f(x) - \langle \nabla f(x), y - x \rangle| \le \frac{L}{2} ||y - x||^2,$$

which geometrically means, that if we'll fix some point  $x_0 \in \mathbb{R}^n$  and define two parabolas:

$$\phi_1(x) = f(x_0) + \langle \nabla f(x_0), x - x_0 \rangle - \frac{L}{2} ||x - x_0||^2,$$
  
$$\phi_2(x) = f(x_0) + \langle \nabla f(x_0), x - x_0 \rangle + \frac{L}{2} ||x - x_0||^2.$$

Then

$$\phi_1(x) < f(x) < \phi_2(x) \quad \forall x \in \mathbb{R}^n.$$

Now, if we have global upper bound on the function, in a form of parabola, we can try to go directly to its minimum

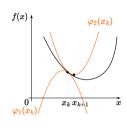

Figure 2: Illustration

If a function  $f:\mathbb{R}^n \to \mathbb{R}$  is continuously differentiable and its gradient satisfies Lipschitz conditions with constant L, then  $\forall x,y\in\mathbb{R}^n$ :

$$|f(y) - f(x) - \langle \nabla f(x), y - x \rangle| \le \frac{L}{2} ||y - x||^2,$$

which geometrically means, that if we'll fix some point  $x_0 \in \mathbb{R}^n$  and define two parabolas:

$$\phi_1(x) = f(x_0) + \langle \nabla f(x_0), x - x_0 \rangle - \frac{L}{2} ||x - x_0||^2,$$
  
$$\phi_2(x) = f(x_0) + \langle \nabla f(x_0), x - x_0 \rangle + \frac{L}{2} ||x - x_0||^2.$$

Then

$$\phi_1(x) < f(x) < \phi_2(x) \quad \forall x \in \mathbb{R}^n.$$

Now, if we have global upper bound on the function, in a form of parabola, we can try to go directly to its minimum

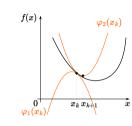

Figure 2: Illustration

$$\nabla \phi_2(x) = 0$$

$$\nabla f(x_0) + L(x^* - x_0) = 0$$

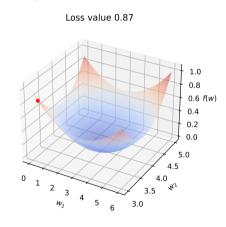

$$x^* = x_0 - \frac{1}{L} \nabla f(x_0)$$

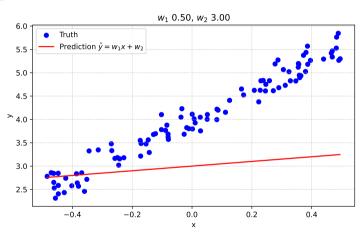

$$x_{k+1} = x_k - \frac{1}{L} \nabla f(x_k)$$

This way leads to the  $\frac{1}{L}$  stepsize choosing. However, often the L constant is not known.

#### **Convergence of Gradient Descent algorithm**

Heavily depends on the choice of the learning rate  $\alpha$ :

## Exact line search aka steepest descent

$$\alpha_k = \arg\min_{\alpha \in \mathbb{R}^+} f(x_{k+1}) = \arg\min_{\alpha \in \mathbb{R}^+} f(x_k - \alpha \nabla f(x_k))$$

More theoretical than practical approach. It also allows you to analyze the convergence, but often exact line search can be difficult if the function calculation takes too long or costs a lot. Interesting theoretical property of this method is that each following iteration is orthogonal to the previous one:

$$\alpha_k = \arg\min_{\alpha \in \mathbb{R}^+} f(x_k - \alpha \nabla f(x_k))$$

Optimality conditions:

$$\nabla f(x_{k+1})^{\top} \nabla f(x_k) = 0$$
