Unconstrained optimization

Constrained optimization

$$\min_{x \in \mathbb{R}^n} f(x) \qquad \qquad \min_{x \in S} f(x)$$

• Any point $x_0 \in \mathbb{R}^n$ is feasible and could be a solution.

Gradient Descent is a great way to solve unconstrained problem

$$x_{k+1} = x_k - \alpha_k \nabla f(x_k) \tag{GD}$$

Unconstrained optimization

Constrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

• Any point $x_0 \in \mathbb{R}^n$ is feasible and could be a solution.

$$\min_{x \in S} f(x)$$

• Not all $x \in \mathbb{R}^n$ is feasible and could be a solution.

Gradient Descent is a great way to solve unconstrained problem

$$x_{k+1} = x_k - \alpha_k \nabla f(x_k) \tag{GD}$$

Unconstrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

• Any point $x_0 \in \mathbb{R}^n$ is feasible and could be a solution.

Constrained optimization

$$\min_{x \in S} f(x)$$

- Not all $x \in \mathbb{R}^n$ is feasible and could be a solution.
- The solution has to be inside the set S.

Gradient Descent is a great way to solve unconstrained problem

$$x_{k+1} = x_k - \alpha_k \nabla f(x_k) \tag{GD}$$

Unconstrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

• Any point $x_0 \in \mathbb{R}^n$ is feasible and could be a solution.

Constrained optimization

$$\min_{x \in S} f(x)$$

- Not all $x \in \mathbb{R}^n$ is feasible and could be a solution.
- The solution has to be inside the set S.
- Example:

$$\frac{1}{2}||Ax - b||_2^2 \to \min_{\|x\|_2^2 \le 1}$$

Gradient Descent is a great way to solve unconstrained problem

$$x_{k+1} = x_k - \alpha_k \nabla f(x_k) \tag{GD}$$

Unconstrained optimization

$$\min_{x \in \mathbb{R}^n} f(x)$$

Gradient Descent is a great way to solve unconstrained problem

$$x_{k+1} = x_k - \alpha_k \nabla f(x_k) \tag{GD}$$

Is it possible to tune GD to fit constrained problem?

Yes. We need to use projections to ensure feasibility on every iteration.

The distance d from point $\mathbf{y} \in \mathbb{R}^n$ to closed set $S \subset \mathbb{R}^n$:

$$d(\mathbf{y}, S, \|\cdot\|) = \inf\{\|x - y\| \mid x \in S\}$$

We will focus on Euclidean projection (other options are possible) of a point $\mathbf{y} \in \mathbb{R}^n$ on set $S \subseteq \mathbb{R}^n$ is a point $\operatorname{\mathsf{proj}}_S(\mathbf{y}) \in S$:

$$\operatorname{proj}_{S}(\mathbf{y}) = \frac{1}{2} \underset{\mathbf{x} \in S}{\operatorname{argmin}} \|x - y\|_{2}^{2}$$

• Sufficient conditions of existence of a projection. If $S \subseteq \mathbb{R}^n$ - closed set, then the projection on set S exists for any point.

The distance d from point $\mathbf{y} \in \mathbb{R}^n$ to closed set $S \subset \mathbb{R}^n$:

$$d(\mathbf{y}, S, \|\cdot\|) = \inf\{\|x - y\| \mid x \in S\}$$

We will focus on Euclidean projection (other options are possible) of a point $\mathbf{y} \in \mathbb{R}^n$ on set $S \subseteq \mathbb{R}^n$ is a point $\operatorname{proj}_S(\mathbf{y}) \in S$:

$$\operatorname{proj}_{S}(\mathbf{y}) = \frac{1}{2} \underset{\mathbf{x} \in S}{\operatorname{argmin}} \|x - y\|_{2}^{2}$$

- Sufficient conditions of existence of a projection. If $S \subseteq \mathbb{R}^n$ closed set, then the projection on set S exists for any point.
- Sufficient conditions of uniqueness of a projection. If $S \subseteq \mathbb{R}^n$ closed convex set, then the projection on set S is unique for any point.

The distance d from point $\mathbf{y} \in \mathbb{R}^n$ to closed set $S \subset \mathbb{R}^n$:

$$d(\mathbf{y}, S, \|\cdot\|) = \inf\{\|x - y\| \mid x \in S\}$$

We will focus on Euclidean projection (other options are possible) of a point $\mathbf{y} \in \mathbb{R}^n$ on set $S \subseteq \mathbb{R}^n$ is a point $\operatorname{\mathsf{proj}}_S(\mathbf{y}) \in S$:

$$\operatorname{proj}_S(\mathbf{y}) = \frac{1}{2} \underset{\mathbf{x} \in S}{\operatorname{argmin}} \|x - y\|_2^2$$

- Sufficient conditions of existence of a projection. If $S \subseteq \mathbb{R}^n$ closed set, then the projection on set S exists for any point.
- Sufficient conditions of uniqueness of a projection. If $S \subseteq \mathbb{R}^n$ closed convex set, then the projection on set S is unique for any point.
- If a set is open, and a point is beyond this set, then its projection on this set does not exist.

The distance d from point $\mathbf{y} \in \mathbb{R}^n$ to closed set $S \subset \mathbb{R}^n$:

$$d(\mathbf{y}, S, \|\cdot\|) = \inf\{\|x - y\| \mid x \in S\}$$

We will focus on Euclidean projection (other options are possible) of a point $\mathbf{y} \in \mathbb{R}^n$ on set $S \subseteq \mathbb{R}^n$ is a point $\operatorname{\mathsf{proj}}_S(\mathbf{y}) \in S$:

$$\operatorname{proj}_S(\mathbf{y}) = \frac{1}{2} \underset{\mathbf{x} \in S}{\operatorname{argmin}} \|x - y\|_2^2$$

- Sufficient conditions of existence of a projection. If $S \subseteq \mathbb{R}^n$ closed set, then the projection on set S exists for any point.
- Sufficient conditions of uniqueness of a projection. If $S \subseteq \mathbb{R}^n$ closed convex set, then the projection on set S is unique for any point.
- If a set is open, and a point is beyond this set, then its projection on this set does not exist.
- If a point is in set, then its projection is the point itself.

Projection criterion (Bourbaki-Cheney-Goldstein inequality)

$$\langle \mathbf{y} - \mathsf{proj}_S(\mathbf{y}), \mathbf{x} - \mathsf{proj}_S(\mathbf{y}) \rangle \leq 0 \quad \forall x \in S.$$

 $f \to \min_{x,y,z}$ Conditional methods

 $\bullet \ \ \text{A function} \ f \ \text{is called non-expansive if} \ f \ \text{is} \ L\text{-Lipschitz with} \ L \leq 1^{-1}. \ \ \text{That is, for any two points} \ x,y \in \text{dom} f,$

$$||f(x) - f(y)|| \le L||x - y||$$
, where $L \le 1$.

It means the distance between the mapped points is possibly smaller than that of the unmapped points.

 $^{^{1}\}mbox{Non-expansive}$ becomes contractive if L<1.

 $\bullet \ \ \text{A function} \ f \ \text{is called non-expansive if} \ f \ \text{is} \ L\text{-Lipschitz with} \ L \leq 1^{-1}. \ \ \text{That is, for any two points} \ x,y \in \text{dom} f,$

$$||f(x) - f(y)|| \le L||x - y||$$
, where $L \le 1$.

It means the distance between the mapped points is possibly smaller than that of the unmapped points.

• Projection operator is non-expansive:

$$\|\operatorname{proj}(x) - \operatorname{proj}(y)\|_2 \le \|x - y\|_2.$$

 $^{^{1}\}mbox{Non-expansive becomes contractive if }L<1.$

 $\bullet \ \ \text{A function} \ f \ \text{is called non-expansive if} \ f \ \text{is} \ L\text{-Lipschitz with} \ L \leq 1^{\ 1}. \ \ \text{That is, for any two points} \ x,y \in \text{dom} f,$

$$||f(x) - f(y)|| \le L||x - y||$$
, where $L \le 1$.

It means the distance between the mapped points is possibly smaller than that of the unmapped points.

• Projection operator is non-expansive:

$$\|\mathsf{proj}(x) - \mathsf{proj}(y)\|_2 \le \|x - y\|_2.$$

• Next: variational characterization implies non-expansiveness. i.e.,

$$\langle y - \mathsf{proj}(y), x - \mathsf{proj}(y) \rangle \leq 0 \quad \forall x \in S \qquad \Rightarrow \qquad \|\mathsf{proj}(x) - \mathsf{proj}(y)\|_2 \leq \|x - y\|_2.$$

 $^{^{1}\}mbox{Non-expansive becomes contractive if }L<1.$

Replace x by $\pi(x)$ in Equation 1

Shorthand notation: let $\pi = \text{proj}$ and $\pi(x)$ denotes proj(x).

Begins with the variational characterization / obtuse angle inequality

$$\langle y - \pi(y), x - \pi(y) \rangle \le 0 \quad \forall x \in S.$$

$$\langle y - \pi(y), \pi(x) - \pi(y) \rangle \le 0.$$

(Equation 2)+(Equation 3) will cancel
$$\pi(y)-\pi(x)$$
, not good. So flip the sign of (Equation 3) gives

$$\langle \pi(x) - x, \pi(x) - \pi(y) \rangle < 0.$$

$$-x,\pi(x)$$

(2)

$$\langle y - x, \pi(x) - \pi(y) \rangle \le -\langle \pi(x) - \pi(y), \pi(x) - \pi(y) \rangle$$

$$\langle y - x, \pi(y) - \pi(x) \rangle \ge \|\pi(x) - \pi(y)\|_2^2$$

$$\|(y - x)^\top (\pi(y) - \pi(x))\|_2 \ge \|\pi(x) - \pi(y)\|_2^2$$

Replace y by x and x by $\pi(y)$ in Equation 1

 $\langle x - \pi(x), \pi(y) - \pi(x) \rangle < 0.$

left-hand-side is upper bounded by
$$||y-x||_2||\pi(y)-\pi(x)||_2$$
, we get

$$||y-x||_2 ||\pi(y)-\pi(x)||_2 \ge ||\pi(x)-\pi(y)||_2^2$$
. Cancels $||\pi(x)-\pi(y)||_2$ finishes the proof.

 $\langle u - \pi(u) + \pi(x) - x, \pi(x) - \pi(y) \rangle < 0$

 $\langle y - x + \pi(x) - \pi(y), \pi(x) - \pi(y) \rangle < 0$

Example: projection on the ball

Find $\pi_S(y) = \pi$, if $S = \{x \in \mathbb{R}^n \mid ||x - x_0|| < R\}$. $u \notin S$

Build a hypothesis from the figure: $\pi = x_0 + R \cdot \frac{y - x_0}{\|y - x_0\|}$

Check the inequality for a convex closed set:
$$(\pi-y)^T(x-\pi) \geq 0$$

$$\left(x_{0} - y + R \frac{y - x_{0}}{\|y - x_{0}\|}\right)^{T} \left(x - x_{0} - R \frac{y - x_{0}}{\|y - x_{0}\|}\right) = \text{inequality:}$$

$$\frac{||y-x_0||}{||y-x_0||} \int \left(\frac{||y-x_0||}{||y-x_0||} \right) =$$

$$\frac{R - \|y - x_0\|}{\|y - x_0\|^2} (y - x_0)^T ((x - x_0) \|y - x_0\| - R (y - x_0)) = \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - R \le \frac{\|y - x_0\| \|x - x_0\|}{\|y - x_0\|} - \frac{R - \|y - x_0\|}{\|y - x_0\|} ((y - x_0)^T (x - x_0) - R \|y - x_0\|) = \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - R \le \frac{\|y - x_0\| \|x - x_0\|}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y - x_0\|} - \frac{(y - x_0)^T (x - x_0)}{\|y -$$

$$rac{\left\| x - x_0 \right\|}{\left\| y - x_0 \right\|} \left((y - x_0)^T (x - x_0) - R \|y - x_0\| \right)$$
 $\left(R - \|y - x_0\| \right) \left(\frac{(y - x_0)^T (x - x_0)}{\left\| y - x_0 \right\|} - R \right)$

The first factor is negative for point selection y. The second factor is also negative, which follows from the Cauchy-Bunyakovsky

$$\left(\frac{(y-x_0)(R-\|y-x_0\|)}{\|y-x_0\|}\right)^T \left(\frac{(x-x_0)\|y-x_0\|-R(y-x_0)}{\|y-x_0\|}\right) = (y-x_0)^T (x-x_0) \le \|y-x_0\| \|x-x_0\|$$

Example: projection on the halfspace

Find $\pi_S(y) = \pi$, if $S = \{x \in \mathbb{R}^n \mid c^T x = b\}$, $y \notin S$. Build a hypothesis from the figure: $\pi = y + \alpha c$. Coefficient α is chosen so that $\pi \in S$: $c^T \pi = b$, so:

$$c^{T}(y + \alpha c) = b$$
$$c^{T}y + \alpha c^{T}c = b$$
$$c^{T}y = b - \alpha c^{T}c$$

Check the inequality for a convex closed set: $(\pi-y)^T(x-\pi)\geq 0$

$$(y + \alpha c - y)^{T}(x - y - \alpha c) =$$

$$\alpha c^{T}(x - y - \alpha c) =$$

$$\alpha (c^{T}x) - \alpha (c^{T}y) - \alpha^{2}(c^{T}c) =$$

$$\alpha b - \alpha (b - \alpha c^{T}c) - \alpha^{2}c^{T}c =$$

$$\alpha b - \alpha b + \alpha^{2}c^{T}c - \alpha^{2}c^{T}c = 0 > 0$$
